Continuation of 11. does NOT place the application in condition for allowance because:

Applicant argues oppisite the combination of references that Kinlen teaches the polythiophene derivative as the electrode and as such does not teach the claimed invention. The examiner respectfully disagrees for the reasons below.

Heeney teaches polythiophene derivatives as components of the charge transport layers of the device. Heeney additionally provides anode and cathode layers to the device. Kinlen teaches conductive polymers can be used in both a hole injection and electron injection role in an electroluminescent device. Kinlen also teaches a cathode layer external to the conductive polymer layer. While Kinlen and applicant have acted as their own lexicographers with regard to the cathode structure Kinlen teaches an external cathode layer having a polythiophene layer in contact with the inner face of the external cathode layer.

The combination of references suitably provide an anode and cathode layer and teach or suggest the use of conductive polymers such as those of Heeney in both hole and electron injection roles of the device.
